1. Select or create a directory in which to install the phpmyadmin files. I usually suggest nameing the folder phpmyadmin. For better security they may wish to use something less obvious like 'admin4678'.

3. Create a new user name and password for the PHPMyAdmin interface. The username cannot be the database user name, as database user names are 16 characters long and PHPMyAdmin allows a maximum of 15 characters.

The user should create a unique user name and password for PHPMyAdmin.

Once logged in, the user can start managing his database. All further support is available online by clicking the (?) icon as highlighted in the upper left.

# 3 Un-Installing PHPMyAdmin

Simply click the 'Uninstall' icon. Input the database password when asked for it.

Uninstalling removes the phpmyadmin installation directory and all files therein, as well as the configuration files in /private/phpmyadmin. As noted below, uninstallation does not affect the database which is being managed.

**Note:** If uninstalling fails, manual uninstall can be performed by deleting the phpmyadmin symlink in public and the phpmyadmin folder in /private
